

# HEKKPIPE

Say hello to your new friend - the ultra portable smoking machine!

Fancy for more? See [hekkpipe.com](http://hekkpipe.com) for pro tips and tricks for fresh tasting hookah sessions!

Quality sessions

Ultra portable

Tilt up to 45 degrees

Smoke it anywhere

## For the best experience prep your Hekkipipe the right way

### 1. Take the hookah apart

### 2. Fill the bottle almost half full of cold water

250 ml or 8.5 oz is just perfect.

How much is enough? Attach the stem to the bottle, tilt the bottle horizontally and let the extra water run out.

Or, suck from the hose hole and see if there is any extra water that needs to be poured out.

### Pro tips

- You can **add ice** to the bottle to get tasty and cool smoke.
- Alternatively, keep the bottle with the stem filled with water **in the freezer for 30 mins.**
- When the water comes to the hose, **lift the hookah up and pour the water away from the hose.**
- If you **don't hear the bubbling sound** when smoking, **add some water.**

### 3. Screw on the stem and attach the hose

Guide the hose through the hole in the wooden box onto the hose part of the hookah stem.

You may have to use some force to attach the hose to keep the hose tightened during the session.

### Tobacco pro tips

### 4. Use the needle to pull pieces of tobacco into the bowl

This way you keep the pincers clean of tobacco to easily light the coal.

If you have an additional bowl, prepare this one, too. This is how you enjoy a non-stop hookah session.

- **Shred the chunks of tobacco** into small pieces so heat can strike the tobacco more evenly.
- **Don't pack the bowl above the holes** on the center vortex to leave a space between the foil and the tobacco. This also keeps the holes clean of burnt tobacco.
- Use **only fresh and wet tobacco** as dried tobacco will burn your throat.

Turn the page

### 5. Wrap the hookah bowl with 9 layers of foil

9 layers give you lots of smoke with burning the tobacco.

**Pro tip!** Pull the foil as straight as you can before wrapping it. This helps the air move easily through the foil and also poking holes is easier.

### 6. Poke 30 - 50 holes

Pierce the area marked in blue to get good airflow.

### 7. Place the hookah bowl and the bottle

Place the bowl tightly and make sure the bottle touches the inner back wall of the box.

### 8. Light the coal and place it on the bowl

When using quick-lighting charcoal, hold the coal with pincers while igniting it.

Natural coal needs a lot more exposure to heat to get it red hot. A stove, torch or a fireplace will do the trick.

### 9. Close the lid gently and enjoy your session

You're all done! Good job!

### Coal pro tips

- To better regulate the heat, **break the coal into pieces**. You will get the best smoke when using  $\frac{1}{2}$  of a full round of coal at once.
- Don't place the coal pieces on the foil **until they have finished sparkling and are red hot all over**.
- You can also use a **small-sized natural coal (20x20x20mm)**

### Pro tips for the perfect session

- **Never smoke with the front cover open** as the safety cone can't hold the hot coal in place.
  - If the smoke gets harsh, **blow carefully into the hose to ventilate**. You can also do this to get fresh smoke. If you blow too hard, you might push water into the bowl and ruin your session.
  - To move the coal around on the bowl, **just tilt your Hekkipipe**. It is a good idea to do this after **every 5 minutes** so that the tobacco heats evenly.

If you have any questions or problems, please let me know!

With greetings,

**Karel Kundraťs**
